Owner Capabilities

The `PolydashFactory` and `BuybackRouter` are `Ownable2Step` — ownership transfers need the new owner to call
`acceptOwnership()`. The owner **should be a multisig**. `PolydashLaunch`, `PolydashToken` and `PolydashHook` have
no owner at all.

Golden rule: **every factory setting applies only to launches created after the change.** Each launch copies its
config at creation (`initialize`) and keeps it forever.

What the owner CAN do

PolydashFactory

Function	What it does	Bounds
`setAntiSniperConfig(highFeeBps, feeDuration, capBlocks, capBps)`	Anti-sniper surplus start rate, decay time, wallet-cap window and cap size for future launches	fee ≤ 20%, duration ≤ 1h, cap window ≤ 100 blocks, `0 < capBps ≤ 100%`
`setGraduationTarget(mode, value)`	Graduate on ETH raised or on market cap	ETH mode: 0.1 – 10,000 ETH; mcap mode: `0 < value ≤ 10M ETH`
`setBuybackConfig(enabled, bps, router)`	Send a share of **platform** fees to the BuybackRouter	`bps ≤ 100%`; router required when enabled. Never touches creator fees
`setTradingRewardsPool(pool)`	Destination of bought-back $POLYDASH	`address(0)` allowed = buyback disabled (router reverts, factory falls back to sending everything to the fee wallet)
`initiateFeeWalletChange(w)` / `executeFeeWalletChange()` / `cancelFeeWalletChange()`	Change the **platform** fee wallet	**48h timelock**, `address(0)` rejected
`setHook(hook)`	Hook used by future launches	must report `factory() == this`
`setPostGraduationSellSpike(bps, duration)`	Optional decaying sell surcharge after graduation, donated to locked LP	≤ 10%, ≤ 1h; off by default
`transferOwnership` / `acceptOwnership` / `renounceOwnership`	OZ Ownable2Step	—

`collectPlatformFees(launch)` / `collectPlatformFeesMany(...)` are **permissionless** — funds can only go to the
configured fee wallet / buyback router.

BuybackRouter

Function	Bounds
`setMaxSlippageBps(bps)`	≤ 10% vs. TWAP
`setTwapWindow(seconds)`	60 s – 1 day
`setPool(pool, fee)`	non-zero

PolydashCommitVault has **no owner and no admin functions** at all: no fee, pause, sweep or upgrade. Its funds
only move via user `deposit` / `withdraw` / `claim` and the permissionless `settle`.

What the owner CANNOT do

- **Change the 0.2% platform fee.** `PLATFORM_FEE_BPS = 20` is a compile-time constant; no setter exists
  (`test_NoPlatformFeeSetterSelectorExists`).
- **Touch creator fees** — change the rate, redirect, pause or seize them (see `CREATOR_FEE_SAFETY.md`).
- **Change a live launch** — curve parameters, graduation threshold, anti-sniper config, hook and fee rate are frozen
  per launch.
- **Remove or move graduated liquidity.** The hook owns the LP and has no removal code path.
- **Mint, pause, blacklist or tax** any launched token — `PolydashToken` has no owner.
- **Withdraw curve ETH, commitments or refunds** from a launch.
- **Upgrade** anything — no proxies with admin rights; launch clones point at an immutable implementation.
- **Deploy to mainnet by accident** — `Deploy.s.sol` reverts on Robinhood Chain unless `I_HAVE_WRITTEN_APPROVAL_AND_AUDIT=true`.

Worst case if the owner key is compromised

An attacker could: start a fee-wallet change (visible for 48h, cancellable by the real owner only if they still hold
the key — hence the multisig recommendation), route up to 100% of **platform** fees into the buyback, or set harsh
(but bounded) anti-sniper / sell-spike settings for **new** launches. Existing launches, creator fees, user funds and
locked liquidity are unaffected.
